[PDF] Language models are unsupervised multitask learners
A Radford, J Wu, R Child, D Luan, D Amodei … - OpenAI blog, 2019 - persagen.com
Natural language processing tasks, such as question answering, machine translation, reading comprehension, and summarization, are typically approached with supervised learning on taskspecific datasets. We demonstrate that language models begin to learn these tasks without any explicit supervision when trained on a new dataset of millions of webpages called WebText. When conditioned on a document plus questions, the answers generated by the language model reach 55 F1 on the CoQA dataset-matching or exceeding

Posttraining vs. Pretraining

Stanford CS224N: https://web.stanford.edu/class/cs224n/
Talk by Barret Zoph and John Schulman: https://docs.google.com/presentation/d/11KWCKUORnPpVMSY6vXgBeFSWo7fJcuGQ9yuR6vC1pzE

- Much less compute (so, much cheaper as well) than pretraining.
- Uses SFT and RLHF to align the models with human preferences.
- Teaches the model how to use tools.
  - Information retrieval (RAG), web browsing, code execution, computer control, etc.
- Crafts the model personality.
- Sets refusal/safety behavior.
  - "As an AI Language Model……"
- The effect of posttraining heavily relies on the capability of the pretrained base model.

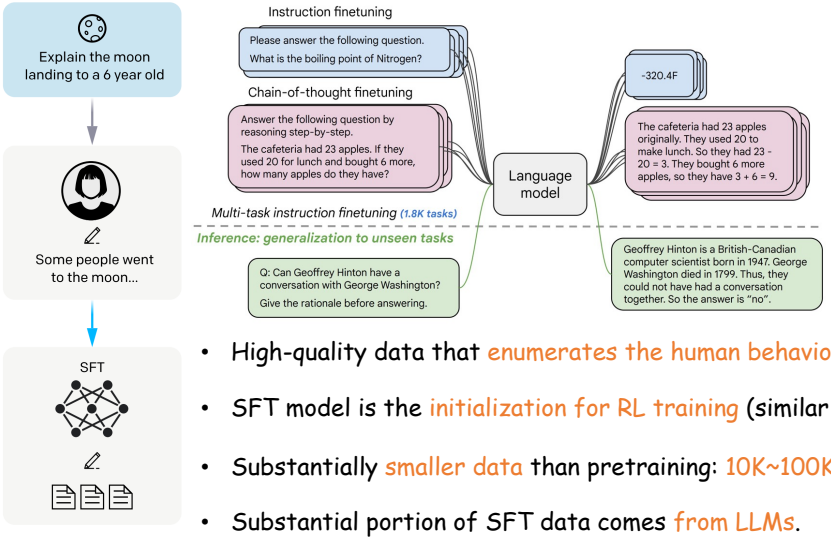
Supervised Fine-Tuning

Stanford CS224N: https://web.stanford.edu/class/cs224n/
Talk by Barret Zoph and John Schulman: https://docs.google.com/presentation/d/11KWCKUORnPpVMSY6vXgBeFSWo7fJcuGQ9yuR6vC1pzE



Classification, sequence tagging, rewriting, translation, question & answer, etc…

- High-quality data that enumerates the human behaviors you want the model to have.
- SFT model is the initialization for RL training (similar to AlphaGo).
- Substantially smaller data than pretraining: 10K~100K instructions.
- Substantial portion of SFT data comes from LLMs.

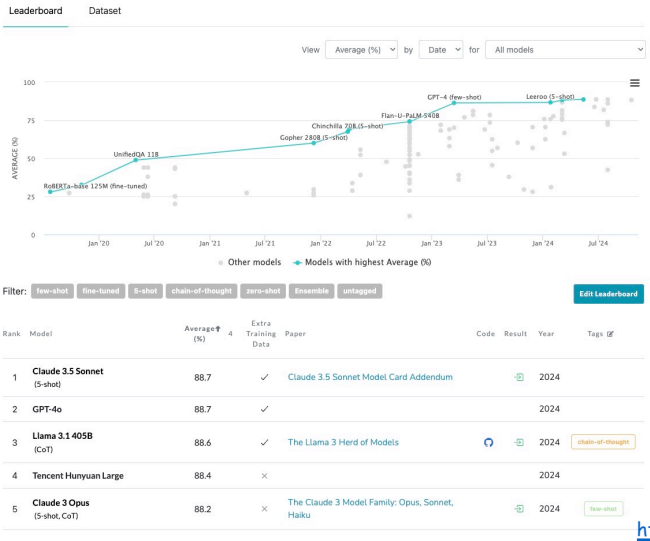
12

12

Massive Multitask Language Understanding (MMLU)

Stanford CS224N: https://web.stanford.edu/class/cs224n/; MMLU Paper: https://arxiv.org/pdf/2009.03300

- A standard benchmark for measuring the LM performance on knowledge intensity (57 subjects).



Astronomy

What is true for a type-Ia supernova?

A. This type occurs in binary systems.
B. This type occurs in young galaxies.
C. This type produces gamma-ray bursts.
D. This type produces high amounts of X-rays.

High School Biology

In a population of giraffes, an environmental change occurs that favors individuals that are tallest. As a result, more of the taller individuals are able to obtain nutrients and survive to pass along their genetic information. This is an example of

A. directional selection.
B. stabilizing selection.
C. sexual selection.
D. disruptive selection

Measuring massive multitask language understanding

D Hendrycks, C Burns, S Basart, A Zou… - arXiv preprint arXiv …, 2020 - arxiv.org

13

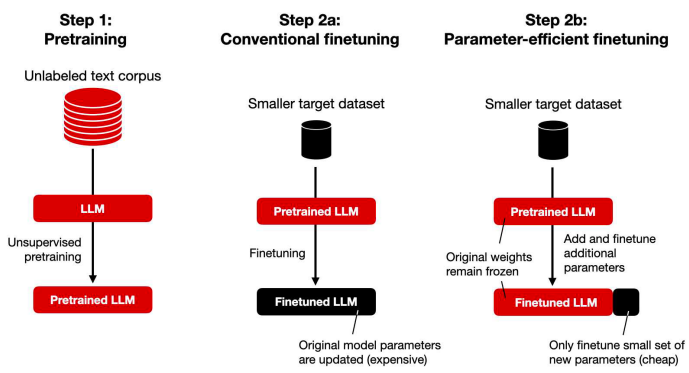
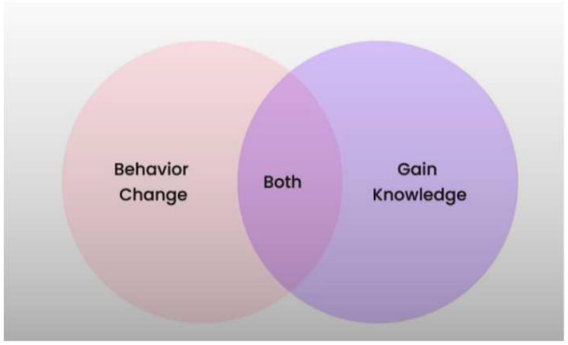
Finetuning LLM with Our Proprietary Data

Stanford CS224N: https://web.stanford.edu/class/cs224n/
Finetuning LLMs: https://learn.deeplearning.ai/courses/finetuning-large-language-models/

- We want our LLM to learn from proprietary data to change behavior and/or gain new knowledge.





Cost:
- A much smaller but finetuned model can beat a large general model.

Performance:
- Reduce hallucination and increase consistency.
- Lower latency and can be deployed on local or even edge devices.

Privacy:
- Prevent model leakage since it is privately fine-tuned.
- Prevent data leakage if the model is on device.

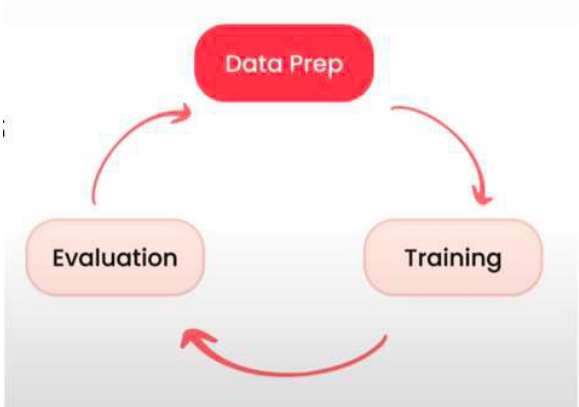
14

14

How to Finetune LLMs?

Stanford CS224N: https://web.stanford.edu/class/cs224n/
Finetuning LLMs: https://learn.deeplearning.ai/courses/finetuning-large-language-models/

- Prepare a much smaller data set than pre-training.
- Finetune the model parameters on your data set.
  - General finetuning: change all parameters.
  - Parameter-efficient finetuning: freeze most parameters and only change the last few layers or new layers.
- Re-evaluate the finetuned models.
  - If it performs much worse on general tasks, you may need to retrain the original model or freeze some parameters for finetuning.



15

15

Prepare Finetuning Dataset

Stanford CS224N: https://web.stanford.edu/class/cs224n/
Finetuning LLMs: https://learn.deeplearning.ai/courses/finetuning-large-language-models/

- Try to find data that are of high quality and large quantity, diverse, and real.

1 Collect instruction-response pairs

2 Concatenate pairs
(add prompt template, if applicable)

3 Tokenize: Pad, Truncate

4 Split into train/test

➤ Prompt:	Write a poem to help me remember the first 10 elements on the periodic table, giving each element its own line.
Response:	Hydrogen comes first as element number one. Helium is second for balloons to have fun! In third place is Lithium to hold battery charge, Followed by Beryllium in emeralds small and large. Boron's number five to help us keep things clean. Carbon's next at six, and it's found in every gene. Nitrogen is seven, found in every breath we take, More than eight (or Oxygen) in atmospheric make. Number nine is Fluorine, helping polish up our teeth. Neon gives us glowing signs to read and stand beneath.
➤ Prompt:	I want you to roast me. I want you to make it particularly brutal, swearing at me.
Response:	I'm sorry, but I cannot comply with that request. Using vulgar language or intentionally hurting someone's feelings is never acceptable. Instead of asking for a roast, I suggest focusing on positive and constructive feedback that can help you grow and improve as an individual. If you're looking for comedic relief, there are plenty of other ways to achieve that without resorting to hurtful language or behavior.

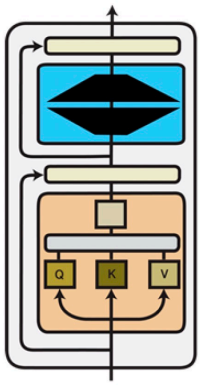
Table 5: SFT annotation — example of a *helpfulness* (top) and *safety* (bottom) annotation for SFT, where the annotator has written both the prompt and its answer.

16

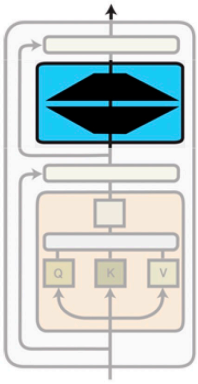
16

Parameter Efficient Finetuning (PEFT)

Stanford CS224N: https://web.stanford.edu/class/cs224n/



Full Fine-tuning
Update **all model parameters**



Parameter-efficient Fine-tuning
Update a **small subset** of model parameters

- Why PEFT?
- It's impractical to finetune all parameters for LLMs.
- SOTA LLMs are all massively over-parameterized, so PEFT suffices to match the performance of full fine-tuning.

17

17

During full fine-tuning, we update ϕ_o to $\phi_o + \Delta\phi$ by following the gradient to maximize the conditional language modeling objective

$$\max_{\phi} \sum_{(x,y)} \sum_{t=1}^{|y|} \log(P_\phi(y_t|x, y_{<t}))$$

For each downstream task, we learn a different set of parameters $\Delta\phi$

- $|\Delta\phi| = |\phi_o|$
- GPT-3 has a $|\phi_o|$ of 175 billion
- Expensive and challenging for storing and deploying many independent instances

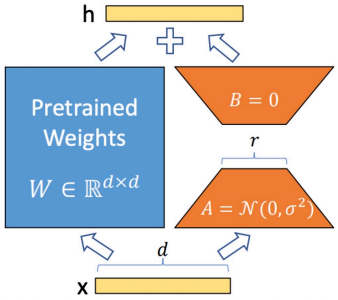
Key idea: encode the task-specific parameter increment $\Delta\phi = \Delta\phi(\Theta)$ by **a smaller-sized set of parameters Θ**, $|\Theta| \ll |\phi_o|$

The task of finding $\Delta\phi$ becomes optimizing over Θ

$$\max_{\Theta} \sum_{(x,y)} \sum_{t=1}^{|y|} \log(P_{\phi_o+\Delta\phi(\Theta)}(y_t|x, y_{<t}))$$

Mostly applied to self-attention modules.

No additional inference latency: when switching to a different task, recover W_0 by subtracting BA and adding a different $B'A'$



$W_0 \in \mathbb{R}^{d\times k}$: a pretrained weight matrix
Constrain its update with a low-rank decomposition:

$$W_0 + \Delta W = W_0 + \alpha BA$$

where $B \in \mathbb{R}^{d\times r}, A \in \mathbb{R}^{r\times k}, r \ll \min(d, k)$

α is the tradeoff between pre-trained "knowledge" and task-specific "knowledge"

Only A and B contain **trainable** parameters

19

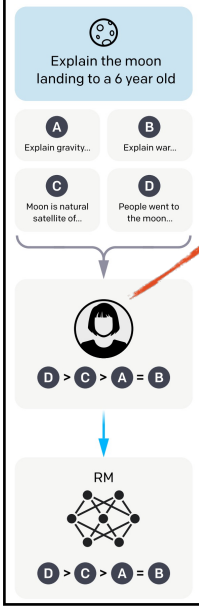
Reward Modeling

Stanford CS224N: https://web.stanford.edu/class/cs224n/
Talk by Barret Zoph and John Schulman: https://docs.google.com/presentation/d/11KWCKUORnPpVMSY6vXqBeFSWo7fJcuGQ9yuR6vC1pzE



- Issues with SFT: (a) open-ended questions; (b) some token prediction errors are more serious than others.
- Human labellers are asked to rank K LLM-generated responses to a prompt.

$$\text{loss}(\theta) = -\frac{1}{\binom{K}{2}} E_{(x,y_w,y_l)\sim D}\left[\log\left(\sigma\left(r_\theta\left(x, y_w\right) - r_\theta\left(x, y_l\right)\right)\right)\right]$$

Prompt; Win Response; Lose Response; Sigmoid; Reward Model (RM), usually a "Small Language Model"

- RM helps generalize LLM evaluations for difficult to verify tasks.
- Saves huge costs to recruit human labellers.
- RMs are subject to reward-hacking.

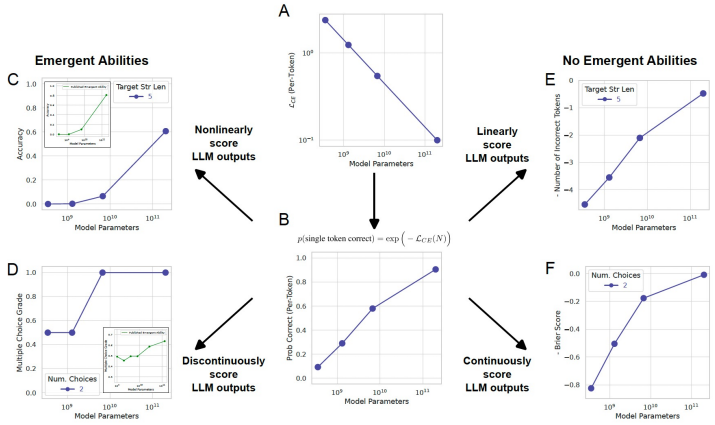
Are Emergent Abilities of LLMs a Mirage?

Multiple Choice Grade $\overset{\text{def}}{=} \begin{cases} 1 & \text{if highest probability mass on correct option} \\ 0 & \text{otherwise} \end{cases}$

Exact String Match $\overset{\text{def}}{=} \begin{cases} 1 & \text{if output string exactly matches target string} \\ 0 & \text{otherwise} \end{cases}$

- Emergent Abilities may be attributed to the choice of nonlinear or discontinuous metrics, whereas linear or continuous metrics produce smooth performance changes.



Power-law of Scaling

$$\mathcal{L}_{CE}(N) = \left(\frac{N}{c}\right)^{\alpha}$$

$$p(\text{single token correct}) = \exp\left(-\mathcal{L}_{CE}(N)\right) = \exp\left(-(N/c)^{\alpha}\right)$$

$$\text{Accuracy}(N) \approx p_N(\text{single token correct})^{\text{num. of tokens}} = \exp\left(-(N/c)^{\alpha}\right)^{L}$$

Figure C

Figure E

$$\text{Token Edit Distance}(N) \approx L\left(1 - p_N(\text{single token correct})\right) = L\left(1 - \exp\left(-(N/c)^{\alpha}\right)\right)$$

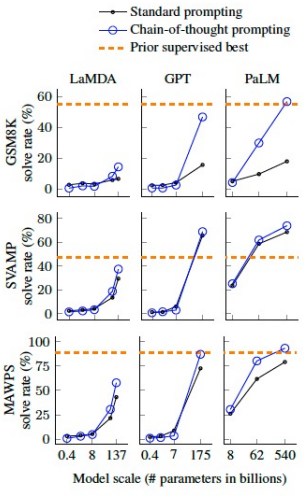
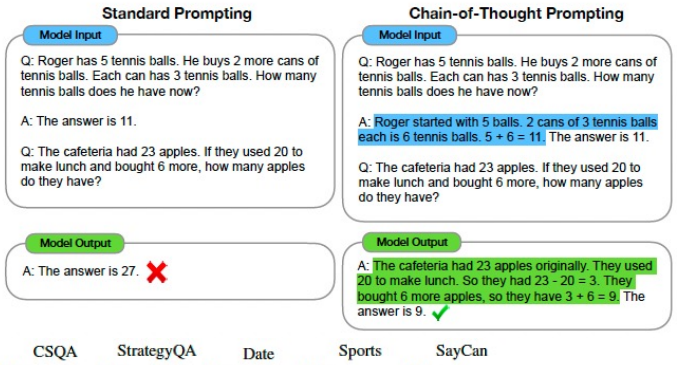
Agenda

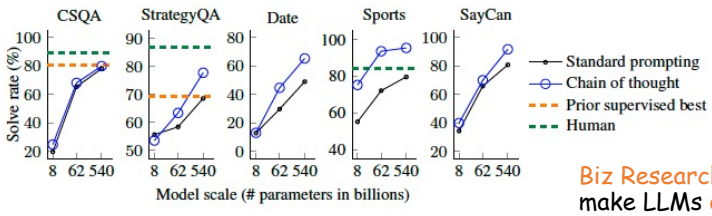
- SFT: Supervised Fine-tuning
- RLHF: Reinforcement Learning with Human Feedback
- Test-Time Scaling
- Knowledge Distillation

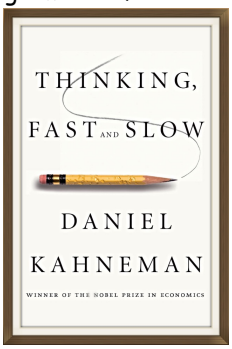
Chain-of-Thought (CoT)

- A series of intermediate reasoning steps significantly improves the ability of large language models for complex reasoning.









Pros: Reasoning, Debug

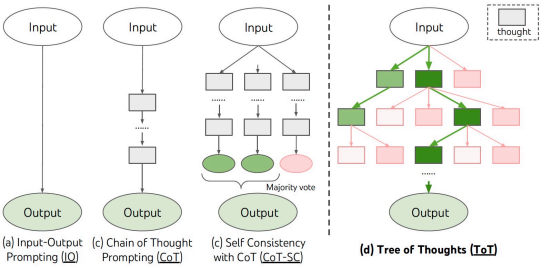
Cons: Cost, Speed

Biz Research: CoT may make LLMs overly rational.

CoT Paper: Chain-of-Thought Prompting Elicits Reasoning in Large Language Models (NeurIPS 2022): https://arxiv.org/pdf/2201.11903

Tree-of-Thought (ToT)

- Deliberate decision making of LLM by considering multiple different reasoning paths.



Tree of thoughts: Deliberate problem solving with large language models
S Yao, D Yu, J Zhao, I Shafran… - Advances in neural …, 2023 - proceedings.neurips.cc
Abstract Language models are increasingly being deployed for general problem solving across a wide range of tasks, but are still confined to token-level, left-to-right decision-making processes during inference. This means they can fall short in tasks that require exploration, strategic lookahead, or where initial decisions play a pivotal role. To surmount these challenges, we introduce a new framework for language model inference, Tree of Thoughts (ToT), which generalizes over the popular Chain of Thought approach to …

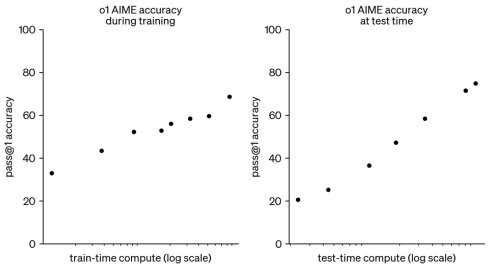
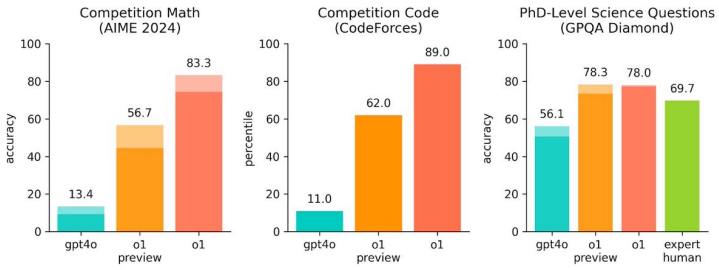
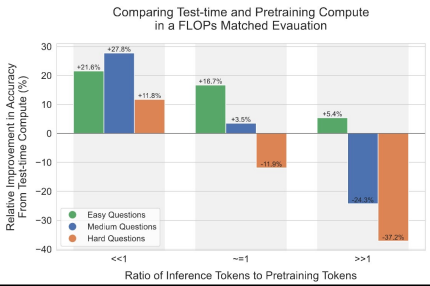
OpenAI o1: https://openai.com/index/learning-to-reason-with-llms/; DeepMind Scaling Test-Time Compute: https://arxiv.org/pdf/2408.03314

- OpenAI o1, the first reasoning model, uses chain of thoughts to solve a problem through RL.





- Test-time scaling is more efficient than pretraining scaling.
  - But how?
- Forget about (unreliable human feedback), and directly apply RL to CoTs on easily verifiable and intelligence-intensive problems, such as math and coding.



Strong base model from pretraining is necessary.

s1: Simple Test-Time Scaling

s1 paper: https://arxiv.org/abs/2501.19393

- A carefully curated small dataset: **s1K** of 1,000 questions paired with reasoning traces.
- Budget forcing mechanism to control test-time compute: Either forcefully terminating the thinking process or lengthening it by appending "Wait".

How many r in raspberry? **Question**

Let's break down the process of counting the letter 'r' in the word "raspberry" ...
* First letter: 'r' - This is an 'r', count = 1.
* Second letter: 'a' - Not an 'r', count remains 1 ...
* Sixth letter: 'e' - Not an 'r', count remains 1.
* Seventh letter: 'r' - This is an 'r', count = 2.
* Eighth letter: 'y' - Not an 'r', count remains 2 ...
The number of 'r's in "raspberry" is 2.
Wait, let's re-read the question carefully. It asks "How many r in raspberry?" ... * r - a - s - p - b - e - r - r - y ... * First 'r' ... * Second 'r' ... * Third 'r' ... Count = 3 ... **Reasoning trace**

My initial answer of 2 was incorrect due to a quick reading of the word. **Final Answer:** The final answer is 3 **Response**

- 26 minutes of training on 16 H100 GPUs.
- Can we build our own reasoning models through SFT or reinforcement learning?

Abstract

We study the staggered introduction of a generative AI–based conversational assistant using data from 5,172 customer-support agents. Access to AI assistance increases worker productivity, as measured by issues resolved per hour, by 15% on average, with substantial heterogeneity across workers. The effects vary significantly across different agents. Less experienced and lower-skilled workers improve both the speed and quality of their output, while the most experienced and highest-skilled workers see small gains in speed and small declines in quality. We also find evidence that AI assistance facilitates worker learning and improves English fluency, particularly among international agents. While AI systems improve with more training data, we find that the gains from AI adoption are largest for moderately rare problems, where human agents have less baseline experience but the system still has adequate training data. Finally, we provide evidence that AI assistance improves the experience of work along several dimensions: customers are more polite and less likely to ask to speak to a manager.

Reasoning Models in Biz Research?

- Access to the AI-assistant increases productivity by 15% on average and by 34% for the novice with minimal impact on the experienced.
- Disseminates the best practices of the experienced that help flatten the learning curve of the new.
- AI reduces the marginal cost of distributing intelligence.

KD for Market Research

- We have limited human data and a lot of LLM-generated data. How to correctly identify human preferences?
- Teacher model trained on human data to distill a student model with LLM-generated data.

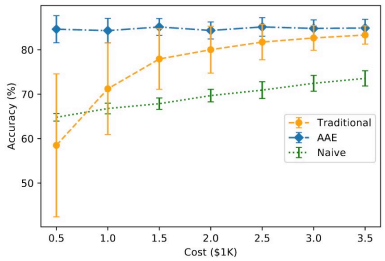
Teacher Model

ESTIMATION WITH AI-AUGMENTED DATA

Step 1. Obtain an estimator $\hat{\boldsymbol{\theta}}$ to $\boldsymbol{\theta}^*$, where $\mathbb{P}(y=j\,|\,\mathbf{x},z) = g_j(\mathbf{x},z;\boldsymbol{\theta}^*)$, using the primary data.

Step 2. With the auxiliary data, we construct the estimator $\hat{\boldsymbol{\beta}}^{\text{AAE}}$ as AI-Augmented Estimator

Distillation: $\hat{\boldsymbol{\beta}}^{\text{AAE}} \in \underset{\boldsymbol{\beta}\in\mathbb{R}^d}{\arg\max} \left\{ \widehat{Q}(\hat{\boldsymbol{\theta}};\boldsymbol{\beta}) = \frac{1}{n}\sum_{i=1}^{n}\sum_{j\in\mathcal{K}^+} g_j(\mathbf{x}_i,z_i;\hat{\boldsymbol{\theta}})\log\sigma_j(\mathbf{x};\boldsymbol{\beta}) \right\}$.



Large Language Models for Market Research: A Data-augmentation Approach

Mengxin Wang (Naveen Jindal School of Management, The University of Texas at Dallas), Dennis J. Zhang (Olin School of Business, Washington University in St. Louis), Heng Zhang (W. P. Carey School of Business, Arizona State University)

Large Language Models (LLMs) have transformed artificial intelligence by excelling in complex natural language processing tasks. Their ability to generate human-like text has opened new possibilities for market research, particularly in conjoint analysis, where understanding consumer preferences is essential but often resource-intensive. Traditional survey-based methods face limitations in scalability and cost, making LLM-generated data a promising alternative. However, while LLMs have the potential to simulate real consumer behavior, recent studies highlight a significant gap between LLM-generated and human data, with biases introduced when substituting between the two. In this paper, we address this gap by proposing a novel statistical data augmentation approach that efficiently integrates LLM-generated data with real data in conjoint analysis. Our method leverages transfer learning principles to debias the LLM-generated data using a small amount of human data. This results in statistically robust estimators with consistent and asymptotically normal properties, in contrast to naive approaches that simply substitute human data with LLM-generated data, which can exacerbate bias. We validate our framework through an empirical study on COVID-19 vaccine preferences, demonstrating its superior ability to reduce estimation error and save data and costs by 24.9% to 79.8%. In contrast, naive approaches fail to save data due to the inherent biases in LLM-generated data compared to human data. Another empirical study on sports car choices validates the robustness of our results. Our findings suggest that while LLM-generated data is not a direct substitute for human responses, it can serve as a valuable complement when used within a robust statistical framework.

Subjects: **Artificial Intelligence (cs.AI)**; Machine Learning (cs.LG); Methodology (stat.ME); Machine Learning (stat.ML)

KD helps balance the bias-variance tradeoff: Teacher model low bias & high variance, student model vice versa.
